

COMPLIANCE COMPONENT

DEFINITION	
<i>Name</i>	Data Integrity and Validation
<i>Description</i>	Data Integrity is the assurance that information is unchanged from its source, and has not been accidentally or maliciously modified, altered or destroyed. Validation is the tests and evaluations used to determine compliance with security specifications and requirements.
<i>Rationale</i>	Data integrity and validation minimize the risk to agency systems from malicious software and intrusions, or from accidental alteration or destruction.
<i>Benefits</i>	Data integrity addresses: <ul style="list-style-type: none"> • Protecting information from accidental or malicious alteration or destruction • Providing assurance that the information meets expectations about its quality • Providing assurance that the information has not been altered Validation: <ul style="list-style-type: none"> • Establishes compliance with security specifications and requirements

COMPLIANCE DETAIL	
<i>State the Guideline, Standard or Legislation</i>	<p>In computer systems, it is not always possible for humans to scan information to determine if data has been erased, added, or modified. Even if scanning were possible, the individual may have no way of knowing what the correct data should be. It is therefore desirable to have an automated means of detecting both intentional and unintentional modifications of data.</p> <ul style="list-style-type: none"> • Data integrity - Reconciliation routines (e.g. checksums, hash totals, record counts) shall be used to ensure software or data has not been modified. • Data validation - Integrity verification programs (e.g. consistency and reasonableness checks, validation during data entry and processing) shall be used to look for evidence of data tampering, errors, and omissions. <p><i>NOTE: Refer to the Application Domain and Systems Management Domain.</i></p>
